## General Details

InFinance describes itself as being a brand new exchange to cater and support small market cap tokens on the Binance Smart Chain. This audit will describe the general safety, risk, and potential of the InFinance Binance Smart Chain project.

They are quite different from other projects as their roadmap and goals are quite unique.

## \$INFC Tokenomics & Notes

These are the general tokenomics for **\$INF**:

- **Initial Supply:** 1,000,000,000,000 (No initial burn. 40% allocated for presale, 30% allocated for locked liquidity, 30% locked or allocated for Marketing, App Development and Community Treasury)
- **Slippage and Fees:** 11% token slippage (4% liquidity fee, 6% redistribution fee)

These tokenomics are considered **static** as no tokens are being burnt. There is no initial burn so there is no "black hole" to reduce the supply. This is okay, as it is not inflationary but manual burns and buybacks may be recommended in the future.

The tokenomics allow for a steady rise in community and price lows, however, discourages trading. Hopefully, this issue is solved by implementing new short-term releasing use cases for the project.

# Project Safety & Risk

# 02

## GENERAL SAFETY AND RISK

One of the main risk alerts on this project is due to this new state as many things can go wrong up to launch such as failure to follow set rules and allocations.

One thing to take note of is the allocation of 30% of the supply away from public usage and could be a risk to investors. However, not all of this is directly accessible so it is somewhat managed.

## CONTRACT

In regards to the \$INFC token, it seems like a safe contract. Fees and functions are present as intended. There are minor compiler warnings however we doubt it would cause any problems. Contract Ownership is said to be renounced on 30 April 2021.

Contract: 0xea4A4E586C10e407E41Cb866B2C31adE9ECE3639

## TEAM

The project team consists of 3 core members that are based in the UK and a few other team members. They have been generally quite transparent and willing to provide details. They have listened to the general advice we have given and also fixed some previous issues. This gives investors more confidence that this project is more "legit". The team is anonymous.

## PRESALE & LAUNCH

The presale, on 1 May 2021, will last for 48 hours with a soft-cap of 100BNB and a hard-cap of 250BNB. Unsold tokens will be locked into the Treasury. There will be a maximum allocation of 1BNB per wallet. This is amazing as it allows a safe range of investors. However, the presale price is 1.60B \$INFC / BNB and the launch price is 1.44 \$INFC / BNB which could risk a dumpage in price upon launch. Be aware, this is a risk, however, the risk is minimized due to the low allocation per wallet.

83% of the presale will be allocated for Liquidity. This is all right as it is over 80%. The launch will be 2 days after the presale has ended.

## Project Potential

### USECASES

The major use case of this project is quite interesting, they plan to make an exchange that supports smaller holders. However, it is not clear how unique this idea would be and how centralized it is going to be. The other use-case which is going to be directly available in the \$INFC token which is a use-case but also a negative impact at the same time due to the 10% fees. However, if a custodial hot-wallet is used inside the exchange, it won't be such a big problem.

### POTENTIAL

This project has some great potential, especially as it's roadmap and goals are much different from other DeFi projects. They plan to make an Exchange while also released a DeFi token, if they carry out all their plans, this could be a very successful project.

There are some risks for this project, mainly because it's very new and there are still crucial things to be carried out. There will be an update on this Audit which will report if the Presale and Launch has been successful.

### SUMMARY

InFinance is a very interesting project. Their token fee may be disruptive and discouraging however due to their unique plans and roadmap, this project may be the next "serious" moonshot. This meaning that this is no meme-coin, this is a real project. As long as the team executes their plans so far as states like Presale and Launch and attempts to make a safe environment for all investors, this project would be great to invest for a medium to long term!

### InFinance Ratings:

Projected Risk Rating: 0/10

Projected Safety Rating 0/10

Combined Risk & Safety Rating: 0/10

Ratings are measured due to current risks and measures and do not necessarily mean a risk or safety issue in the project but possibly its current state. Ratings may increase or decrease as the project progresses.
